Here's a step-by-step trick to generate portfolio projects that actually get recruiters' attention using Claude + HuggingFace:

1️⃣ Go to huggingface.co

Click "Models"

On the left, find the "Tasks" section

2️⃣ Screenshot that entire "Tasks" section

3️⃣ Open Claude

Paste the image

Use this prompt to generate a standout project:

"Based on the screenshot I provided, which shows a full list of available AI tasks on huggingface.co, come up with a unique and technically impressive AI engineering project that would:

Stand out in the 2026 AI engineering job market

Be portfolio-worthy for a mid-level software engineer (2–6 YOE) pivoting from SWE into an AI engineering role

Integrate one or more of the tasks shown in the screenshot

Demonstrate production-grade patterns like RAG, multi-agent orchestration, LLM evaluation, and LLMOps (not just an API wrapper)

Be feasible for a solo engineer to ship in 1–3 months

- Use real-world data APIs and practical scenarios

- Go beyond a basic demo with thoughtful system design, eval harness, and scalability

The output should include:

- A clear project name, what it does, and what real-world problem it solves

- Key HuggingFace tasks it uses

- Recommended tech stack (LangChain, LangGraph, LlamaIndex, pgvector, Pinecone, etc.)

- How it maps to real AI engineering JDs

- Resume-ready impact metrics and portfolio value"
